YOUR POSTER TITLE HERE: AND INCLUDE A SUBTITLE IF YOU HAVE ONE

FIRST AUTHOR, SECOND AUTHOR, THIRD AUTHOR
AFFILIATION 1, AFFILIATION 2, AFFILIATION 3

- ➡ Original study title or topic
- ➡ Who did the original research
- ➡ Who is in your group can either go in the 'affiliation' line or be included elsewhere on the poster

- ➔ Summarize why study conducted
- ➔ Any major theories or background
 - 🧠 Minimize text, use bullets or even graphics!
- ➔ What was research question?

- ➔ Describe how they studied topic
- ➔ Describe steps or processes
- ➔ Include who was studied and where

- ➡ Show what they found
- ➡ Focus on the key findings
- ➡ Include graphs & pictures
- ➡ Use minimal text!

Do not worry about the statistics for now! Just tell the story about what they found.

- ➔ Explain why results matter
- ➔ Describe real-world implications
- ➔ Ethics: Discuss any ethical problems with study
 - 🧠 Would IRB approve it today? Why or why not?
 - 🧠 Are there alternatives?

One person, NO vote: The role of the Electoral College in voter abstention

Emma W. Marshall, Katherine P. Hazen, Kayla Sircy & Eve M. Brank

Graphical Abstract

How does the **anti-majoritarian** process of the **Electoral College** impact perceptions of **voice**, **procedural fairness**, and **voting behavior**?

- ❑ Electoral College and winner-takes-all systems denies some citizens **feeling** of having their vote count
- ❑ **Procedural justice** and **voice** in the Electoral College can help to explain individuals' voting experiences and behaviors

1 After 2016 POTUS election, **vote instrumentality** & **voice** also shaped people's ($N=204$) **future voting intentions**

Note: All models control for gender, race, education, knowledge and age. Solid lines indicate $p < .05$, dashed lines indicate $p > .05$. Unstandardized coefficients presented in figure.

2 **Losing** candidate voters in **winner-takes-all** states report experiencing the **Electoral College** as **disregarding** their voice

3 After 2020, voters in **District Based** states believed their vote **contributed more** to state-level outcomes which **increased future voting intentions**

Note: Solid lines indicate $p < .05$, dashed lines indicate $p > .05$. Unstandardized coefficients presented in figure.

4 But voters in **District Based** states & similar **Winner-takes-all** states perceived 2020 election as equally **procedurally fair**

Abstract

Presidential elections in the United States are officially decided by the Electoral College (EC); however, little empirical research has examined how this anti-majoritarian process affects individual voter behaviors. In two studies following the 2016 ($N=204$) and 2020 ($N=196$) Presidential elections, we found that **perceptions of voice** and **procedural fairness** in the Electoral College can help to explain individuals' voting experiences and behaviors.

We would like to thank the Law and Policy Lab at the University of Nebraska-Lincoln for their support, guidance, and work on this project.

NEURAL EVIDENCE FOR A CONTEXT-CHANGE ACCOUNT OF LIST-METHOD DIRECTED FORGETTING

JEREMY R. MANNING*, JUSTIN C. HULBERT, JAMAL A. WILLIAMS, ARE "TEAM DF"
LUIS R. PILOTO, LILI SAHAKYAN, AND KENNETH A. NORMAN

*MANNING3@PRINCETON.EDU

SUPPORTED BY THE JOHN TEMPLETON FOUNDATION, NTH RO1-MH069456, AND ORONS ULS-1009542

INTRODUCTION & METHODS

- THE MENTAL CONTEXT IN WHICH WE EXPERIENCE AN EVENT PLAYS A FUNDAMENTAL ROLE IN HOW WE ORGANIZE OUR MEMORIES AND, IN TURN, HOW WE RETRIEVE THOSE MEMORIES LATER.
- PROCESSES THAT ALTER OUR REPRESENTATIONS OF MENTAL CONTEXT CAN ENHANCE OR DIMINISH OUR CAPACITY TO RETRIEVE PARTICULAR MEMORIES.
- WE DESIGNED AN FMRI EXPERIMENT TO TEST THE HYPOTHESIS THAT PEOPLE CAN INTENTIONALLY FORGET PREVIOUSLY EXPERIENCED EVENTS BY "FLUSHING OUT" THE ASSOCIATED CONTEXTUAL INFORMATION.
- WE USED MYPA-PREDICTED SCENE ACTIVATIONS TO INFER HOW MUCH LIST A CONTEXTUAL INFORMATION WAS PRESENT IN PARTICIPANTS' THOUGHTS THROUGHOUT THE EXPERIMENT.

EXHIBIT 1. WE HAD PARTICIPANTS STUDY TWO LISTS OF WORDS (A AND B), MANIPULATING WHETHER THEY WERE TOLD TO FORGET THE LIST A PRIOR TO STUDYING LIST B. WE ALSO HAD PARTICIPANTS PASSIVELY VIEW IMAGES OF OUTDOOR SCENES PRESENTED BETWEEN THE LIST A WORDS; WE HOPED THESE WOULD BE INTEGRATED INTO LIST A CONTEXTUAL REPRESENTATIONS.

IN SEARCH OF HARD EVIDENCE, TEAM DF TAKES TO THE SEEDY BACK ALLEYS OF PRINCETON, NJ. A SHADOWY FIGURE, KNOWN ONLY AS THE FLASHER APPEARS SUDDENLY, CLAIMING TO HAVE SHOCKING FIRST-HAND KNOWLEDGE OF HOW WE FORGET...

RESULTS PART 1

- PARTICIPANTS REMEMBER FEWER LIST A WORDS AND MORE LIST B WORDS FOLLOWING A FORGET (VS. REMEMBER) CUE.
- SCENE ACTIVATIONS (REFLECTING LIST A CONTEXT) DECREASE MORE FOLLOWING A FORGET (VS. REMEMBER) CUE.
- THE DECREASE IN SCENE-RELATED ACTIVITY FOLLOWING A FORGET CUE PREDICTS PARTICIPANTS' ABILITIES TO RECALL THE LIST A WORDS.

EXHIBIT 2. A. RECALL PERFORMANCE. B. SCENE-RELATED NEURAL ACTIVITY. C. NEURAL TIMECOURSE.

RESULTS PART 2

- WE USED GLMS TO IDENTIFY WHICH REGIONS CONTRIBUTED TO CONTEXTUAL FLUSHING DURING THE CRITICAL PERIOD.
- THESE REGIONS ARE SIMILAR TO THOSE INVOLVED IN FLUSHING OUT "SITUATION MODELS" WHEN WE TRANSITION FROM ONE EVENT TO ANOTHER.
- WE ALSO IDENTIFIED REGIONS THAT RESPONDED DIFFERENTLY DURING LIST B FOLLOWING FORGET VS. REMEMBER CUES.

EXHIBIT 4. A. CRITICAL PERIOD RESPONSES THAT PREDICTED THE DECREASE IN SCENE ACTIVATIONS FROM LIST A TO LIST B. B. LIST B RESPONSES THAT DIFFERED FOR FORGETTING VS. REMEMBER CUES.

OVER MONTHS OF CAREFUL INVESTIGATION, TEAM DF BEGINS TO UNCOVER A TERRIBLE TRUTH. AT LONG LAST, THE FLASHER'S IDENTITY IS REVEALED!

EXHIBIT 3. DECREASE IN SCENE ACTIVATIONS FROM LIST A TO LIST B VS. CORRECT LIST A RECALLS. A. AFTER A FORGET CUE. B. AFTER A REMEMBER CUE.

USING THE LATEST MIND-READING TECHNOLOGY, TEAM DF PROBES THE BRAINS OF 25 UNSUSPECTING VICTIMS. THE FLASHER'S CLAIMS APPEAR TO CHECK OUT, BUT WHERE DOES IT ALL HAPPEN IN THE BRAIN?!

INTERPRETATIONS & CONCLUSIONS

- OUR WORK HIGHLIGHTS THE FUNDAMENTAL ROLE THAT CONTEXTUAL INFORMATION PLAYS IN OUR ABILITY TO ORGANIZE AND RETRIEVE INFORMATION PERTAINING TO PREVIOUS EXPERIENCES.
- WE SHOW THAT ONE TOOL WE USE TO FORGET INFORMATION ABOUT OUR RECENT PAST IS TO FLUSH OUT CONTEXTUAL INFORMATION ASSOCIATED WITH THOSE EXPERIENCES.

ANOTHER CASE SOLVED. WHAT ADVENTURES LIE AHEAD FOR THESE BRAIN SLEUTHS? WHAT OTHER DEEP MYSTERIES OF THE MIND AWAIT DISCOVERY? FIND OUT MORE AT WWW.PRINCETON.EDU/~MANNING3...

Broadband shifts in EEG power spectra are correlated with single-neuron activity in humans

Jeremy R. Manning, Joshua Jacobs, Itzhak Fried, and Michael J. Kahana

University of Pennsylvania, UCLA School of Medicine

1 Introduction

- We studied the relationship between the EEG power spectrum and the firing rates (FR) of individual neurons in the human brain
- Other researchers^{1,2} have noted high correlations between the power of high frequency (γ) oscillations and FR
- We developed a statistical framework to distinguish between broadband shifts in the EEG power spectrum³ and band-specific peaks
- We also examined the correlation between FR and EEG power at narrow frequency bands, including γ

Figure 1. a. Experimental setup. **b.** Two explanations for γ /FR correlation.

2 Methods

Figure 2. Statistical framework. a. The distribution of firing rates is divided into ten equally spaced bins. **b.** A power spectrum is created for each bin. These are used to compute mean fit height and maximum deviation. We then compute the correlation between firing rate and mean fit height (**c**) and maximum deviation (**d**).

3 Results

Figure 4. a. Broadband shifts are more common than band-specific shifts. **b.** Example single-cell spectra exhibiting broadband shifts (left) and average spectra for each of five major brain areas (right). **c.** Which components of the EEG power spectrum significantly correlated with firing rate? **d.** Positive broadband shifts are correlated with FR for all brain regions. **e.** Power at low frequencies is more variable than at high frequencies.

4 Conclusions

- EEG power spectra exhibit broadband shifts when FR changes
- Power at low frequencies is more variable than power at high frequencies
- This explains why γ oscillations are the best predictor of FR

Call Me Maybe, but Not on my Smartphone: Privacy Expectations for Cell Phones

Emma Marshall¹, Kristin Brikmanis¹, Kailey Lawson¹, & Jennifer Groscup²

Pomona College¹ & Scripps College²

ABSTRACT

The Supreme Court recently considered how expectations of privacy for data stored on cell phones should be evaluated (*Riley v. California*, 2014). The current research investigated the level of privacy people expect for the data stored on their cell phones and whether that expectation of privacy differs based on type of cell phone, type of item searched, and the evidence uncovered in the search. Participants ($N=562$) read vignettes about a cell phone search. As expected, results indicate that the type of cell phone and the outcome of the search influence participants' privacy expectations and perceptions of the search.

INTRODUCTION

Searches and Expectations of Privacy

- The 4th Amendment of the U.S. Constitution protects individuals from unreasonable searches and seizures by government actors. The 4th Amendment only applies to searches that violate a "reasonable expectation of privacy." When courts consider whether there was a protected and reasonable expectation of privacy, they consider two things (Katz v. *United States*, 1967):
 - 1) Whether the individual claiming an expectation of privacy had an actual, subjective expectation that the searched area was private.
 - 2) Whether that subjective expectation is one that society is willing to recognize as reasonable.

Research on Expectations of Privacy

- The small body of extant research indicates that privacy expectations differ for searches in different situations and judges' evaluations of privacy expectations may differ from laypersons' actual privacy expectations (Blumenthal, Adya, & Mogile, 2009; Slobogin & Schumacher, 1993a; 1993b).
 - ✦ No previous research has investigated expectations of privacy for electronic communications such as email, text messages, or pager messages.

Actor-Observer Effect

- Other research on 4th Amendment searches has consistently demonstrated an Actor-Observer Effect.
 - ✦ Less expectation of privacy and greater search reasonableness tend to be found by people taking the third-person perspective, such as that of a judge, than by people taking the first-person perspective, such as that of the person being searched (Kagehiro, 1988, 1990; Kagehiro, Taylor, Laufer, & Harland, 1991; Slobogin & Schumacher, 1993).

Court Decision Making

- Courts are beginning to grapple with government searches of cell phones and other "digital containers", as evidenced by the recent Supreme Court case *Riley v. California* (2014) involving the warrantless search of a cell phone during an arrest.
 - ✦ Concluded that the police must get a warrant before searching a cell phone seized incident to arrest because "cell phones differ in both a quantitative and a qualitative sense from other objects that might be kept on an arrestee's person".
 - The Courts' evaluation of cell phone data privacy in *Riley* specifically cited both the large storage capacity of modern smartphones and their ability to access additional data stored on remote servers.
 - ✦ Raises the issue of whether expectations of privacy differ based on the qualities of the cell phone being searched (i.e., smartphones vs. prepaid, or "burner", lower-quality phones).
 - Scope of *Riley* was explicitly limited to searches of cell phones incident to arrest.
 - ✦ Raises the issue of how the Courts consider the privacy of cell phone data when searched in other contexts.

METHODS

Design

2 (type of cell phone searched) x 2 (type of item searched) x 2 (evidence uncovered in the search) between-groups factorial design.

Participants

562 community members recruited on MTurk, an online, work distribution website:

- Gender: 43.5% Female, 56.3% Male
- Age: Mean age = 33.90 years ($SD=11.32$, range: 19 to 75).
- Ethnicity: 77.1% White, 8.2% African-American, 5.9% Latino/Latina, 7.5% Asian/Pacific Islander, 1.3% Other

Materials and Procedures:

- Read a short vignette describing a search of a cell phone during a routine traffic stop.
- The search was based on suspicion of distracted driving and was conducted without consent.
- In the vignette these factors were manipulated:
 - Type of cell phone searched: Smartphone vs. Prepaid "Burner" Phone
 - Type of item searched: Text Messages vs. Pictures
 - Evidence uncovered in the search: No Evidence vs. Evidence of drug use
- Participants rated agreement with statements evaluating the search of the cell phone (See Table 1 for summary of statements).
- Then participants rated agreement with the same statements as if they had been the target of the search.
- Participants also completed measures assessing attitudes about police searches, technology, and illegal drugs.

RESULTS

Hypothesis 1: Privacy expectations and perceptions of the search will differ based on the type of cell phone searched, after controlling for participant attitudes towards illegal drugs.

- Consistent with the Court in *Riley* and our hypothesis, participants rated higher agreement that the search would have been reasonable to expect privacy and lower agreement that the search would have been consented for the search of the smartphone compared to a prepaid phone (See Table 1).
- However, contrary to hypothesis participants' ratings of the searchee's subjective privacy interest, embarrassment level, and the government interest in conducting the search did not differ based on the type of cell phone searched (See Table 1).

Hypothesis 2: Privacy expectations and perceptions of the search will differ based on whether or not the search uncovered evidence of drug activity by the searchee, after controlling for participant attitudes towards drug use.

- Consistent with our hypothesis, the outcome of the search influenced participants' evaluations such that they rated higher agreement that the searchee should expect privacy and the searchee would have consented for a search that uncovered no illegal activity than for a search uncovering various evidence of drug use (See Table 1).

- Additionally, participants' perceptions of the searchee's feelings during the search also differed based on the outcome of the search, such that ratings of searchee embarrassment and perceptions of wrongdoing were higher when evidence of drug use was uncovered (See Table 1).

Table 1: The Effects of Cell Phone and Evidence on Perceptions of Search

	Type of Cell Phone				Evidence Uncovered			
	Smartphone (M=SD)	Burner (M=SD)	Effect size η^2	No Evidence (M=SD)	Drug Use (M=SD)	Effect size η^2		
Objective Privacy Expectations								
Should be private	6.12(1.35)	6.07(1.28)	.001	6.28(1.17)	5.99(1.44)	.017**		
Reasonable to expect privacy	6.10(1.35)	5.89(1.46)	.009*	5.98(1.44)	6.01(1.36)	.001		
Subjective Privacy Expectations								
Expected to be private	6.09(1.26)	6.07(1.24)	<.001	6.05(1.14)	6.10(1.32)	<.001		
Invaded privacy	6.20(1.30)	6.11(1.26)	.003	6.19(1.15)	6.11(1.39)	.006		
Feelings								
Embarrassed by search	5.56(1.56)	5.73(1.49)	<.001	4.87(1.40)	5.85(1.28)	.009**		
Perceived wrong-doing	5.57(1.61)	5.26(1.89)	.002**	4.78(1.47)	6.01(1.13)	.151***		
Government Interest								
Important to search	3.17(1.85)	3.24(1.81)	.003	3.20(1.54)	3.21(1.91)	.005		
Protected public safety	2.77(1.75)	2.82(1.78)	.006	2.88(1.47)	2.81(1.86)	.002		
Consent								
Likelihood of Consent	2.53(1.60)	2.80(1.74)	.019**	3.40(1.64)	2.83(1.41)	.158***		

Note: * $p < .05$, ** $p < .01$, *** $p < .001$. Responses were measured on seven-point Likert-type scales with higher values indicating more agreement with each of the statements.

Hypothesis 3: Privacy expectations and perceptions of the search will differ based on the item searched, such that privacy expectations and search intrusiveness will be higher for searches of text messages than pictures saved on the cell phone.

- Contrary to hypothesis participants rated searches of text messages as equally intrusive and private as searches of pictures. However, the item searched influenced perceptions of searchee embarrassment, such that participants rated higher agreement that the search would have been embarrassing when the search was of text messages ($M=5.57$, $SD=1.38$) versus pictures ($M=5.18$, $SD=1.62$, $F(1,544)=11.08$, $MSe=2.05$, $p<.001$, $\eta^2=.020$).

- Participants also rated the likelihood that the searchee would consent to the search as higher for searches of pictures ($M=2.85$, $SD=1.73$) than text messages ($M=2.54$, $SD=1.62$, $F(1,545)=6.61$, $MSe=2.26$, $p=.010$, $\eta^2=.012$).

RESULTS

Hypothesis 4: Consistent with the Actor-Observer effect, participant evaluations of the search will be different when they are asked to imagine themselves as the searchee.

Table 2: Perceptions of Search from Third- vs. First-Person Perspective

	Means (Standard Deviations)		<i>t</i> (df)	Effect Size Cohen's <i>d</i>
	Defendant Search (Third Person)	You Search (First Person)		
Objective Privacy Expectations				
Should be private	6.09(1.31)	6.25(1.21)	-4.91 (537)	.21***
Reasonable to expect privacy	5.98(1.41)	5.97(1.48)	0.24 (543)	0.01
Subjective Privacy Expectations				
Expected to be private	6.08(1.24)	6.09(1.44)	-0.29 (538)	-0.01
Invaded privacy	6.14(1.28)	6.25(1.20)	-4.27 (549)	.18***
Feelings				
Embarrassed by search	5.38(1.53)	4.98(1.98)	5.08 (555)	.22***
Perceived wrong-doing	5.41(1.65)	4.96(1.94)	6.47 (534)	.28***
Government Interest				
Important to search	3.21(1.83)	3.03(2.00)	3.82 (553)	.13***
Protected public safety	2.85(1.77)	2.79(1.79)	0.61 (553)	0.24***
Consent				
Likelihood of Consent	2.71(1.69)	3.18(2.12)	-5.06 (556)	.21***

Note: * $p < .05$, ** $p < .01$, *** $p < .001$. Responses were measured on seven-point Likert-type scales with higher values indicating more agreement with each of the statements.

DISCUSSION

- Consistent with the assumptions of the Court in *Riley*, participants thought it would be more reasonable to expect privacy for a search of a smartphone than a pre-paid "burner" cell phone.
 - ✦ Indicates that *Riley* accurately determined that people have a reasonable expectation of privacy for the digital contents of their smartphones.
- However, people considered a search of a cell phone to be an equivalent invasion of privacy when the cell phone lacked the high storage capacity and advanced features of modern smartphones.
 - ✦ Suggests that, while the qualities of the device on which cell phone data is accessed or stored are relevant to a privacy analysis for cell phone searches, other factors related to the privacy expectations for the individual pieces of digital content or data being searched should also be considered by the Court in future evaluations of privacy and reasonableness for digital content.
- Whether or not the search uncovered evidence of illegal activity by the searchee influenced participants' evaluations of the search, such that the searchee should expect privacy, and perceptions of the searchee when no illegal information was uncovered.
 - ✦ These results also have implications in the courts as the Courts have been clear that the objective "reasonableness" part of this test should be based on what an "innocent person" would feel under the circumstances, indicating a higher level of privacy may be reasonable (*Florida v. Bostick*, 1991).
- Consistent with the Actor-Observer Effect, participants rated agreement that the searched item should be private, intrusiveness, and likelihood of consent as lower and embarrassment and the government interest in the search as higher when they took the perspective of a third-party observer than when they were asked to imagine themselves as the searchee. Similarly, all participants evaluated the search equivalently on how much privacy would be expected and how reasonable it would be to expect privacy for what was searched regardless of perspective.
- ✦ These results have implications for judicial decisions about the reasonableness of searches of cell phones and the information stored on them because this observer bias could influence judicial evaluations of privacy expectations for digital data.
- ◆ Limitations to this research include the use of a short vignette, an online survey methodology, and the use of one type of search scenario.
- ◆ Future research in this area should investigate privacy expectations for and searches of other types of electronic communications and data, such as data stored on remote cloud servers. Research should also investigate a wider variety of arrest and non-arrest related search scenarios to expand the generalizability of the findings.

Blame Attributions and Rape: Effects of Belief in a Just World and Relationship Level

Abstract

When victims of rape are blamed for their own victimization, it can lead to secondary victimization. The purpose of this study is to investigate the factors that lead to victim blaming. The current study looked at the effect of belief in a just world (BJW), gender of participant, and the level of relationship closeness between victim and perpetrator. These variables studied the level of attribution of both victim and perpetrator blame. A community sample ($N = 166$) read four scenarios and then answered questions about victim blame and perpetrator blame. Overall, the blame attributed to the perpetrator was high while blame attributed to the victim was low. The victim of stranger rape was blamed more than the victim who knew the perpetrator. Participants that had high levels of BJW attributed the higher levels of blame to victims and lower levels of blame to perpetrator.

Introduction

Previous research suggests that individuals have a tendency to blame rape survivors for their rape. One explanation for this is the Just World Theory. When individuals have a high belief in a just world (BJW) they blame the victim to ensure the idea that bad things don't happen to good people. This theory has not been tested previously in research on victim blaming.

According to the Swedish Crime Prevention Council, the most common type of rape is rape of an acquaintance or friend. Previous research found that the closer the level of relationship, the more blame that is placed on the victim. Previous studies have also showed a sample bias with using only undergraduate students.

Methods

This study is comprised of a community sample of 166 people, 85 of them women, 80 of them men, one withholding gender. People between the ages of 15 and 84 participated, having been approached in public places to volunteer to take part in a short study with compensation of a lottery ticket. The participants filled out a Belief in a Just World scale, which has been used in multiple studies. This was used as the independent variable.

This study used four two-part questionnaires containing a rape scenario in which relationship level was manipulated. Each participant was randomly assigned to one of the scenarios. The participants read a constructed news story vignette about the rape scenario of a woman being sexually assaulted in her home by a male perpetrator. The relationship levels that varied in the perpetrator included a stranger, a friend of a friend, a boyfriend, or a husband. The scenarios included the victim saying "no" repeatedly to sexual advances, but it did not include the word "rape."

After reading the scenario, participants completed the questionnaires, the first part assessing victim blame, and the second part assessed perpetrator blame and classification of the event as rape. All questionnaires used 0-10 rating scales.

Results

The first hypothesis states that more blame would be attributed to the perpetrator than to the victim. We can verify that by the result: with the $t(164) = 32.12, p < .001$. Next, those who received less blame were low on the BJW scale, while those who were blamed more were high on the BJW scale $F(1, 146) = 11.14, p = .001$. The victims of husband, boyfriend, and acquaintance rape all had lower blame than a victim of stranger rape, $p < .02$.

When it came to gender, unlike men, women had significant effects with not only BJW scores but also relationship level, whereas males only had a significant effect with the BJW scores. Women blamed victims more when dealing with high BJW rather than low BJW, $F(1, 77) = 4.44, p = .04$. When dealing with relationship factors, $F(3, 77) = 5.59, p = .002$, victims of stranger rape received the most blame. Like women, men high on BJW blamed more than men with low BJW, $F(1, 77) = 7.53, p = .008$.

Regarding the perpetrator, those with higher BJW put less blame on the perpetrator than did those low on BJW, $F(1, 147) = 10.96, p = .001$. In classification of rape, those high on BJW rated the scenario as rape more often than those low on BJW, $F(1, 147) = 11.51, p = .001$. Lastly, the acquaintance scenario was rated as rape more than the dating and married scenarios.

Discussion

Consistent with hypotheses, overall, perpetrator blame was high and victim blame was low. Although the results generally demonstrate that the Swedish population typically attribute more blame to the perpetrator, the results of the study did demonstrate the occurrence of some victim blaming. As hypothesized, it was found that participants with a high score on BJW attributed more blame to the victim and viewed the perpetrator as less blameworthy. Contrary to the hypothesis that more blame would be attributed to the perpetrator than the victim in the stranger rape scenario, the highest levels of blame were attributed to the victim of a stranger rape. Although these results were unexpected, previous studies have garnered similar results. In these studies, the victim of the stranger rape was described as being raped late at night in a park. It was speculated that the high level of victim blame was due to participants' reasoning that the victim should not have put herself in the position of being out late and alone.

Although the present study's stranger rape scenario did not involve the victim being out late, the victim did ultimately find herself alone stranger. Perhaps that could have been perceived as being a way the victim increased her own risk of being raped, however, further research is necessary to substantiate this. The current study did not find any significant main effects for gender of participant, in contrast to past studies, and it is proposed that this may be due to the more egalitarian sex roles in Sweden. Cross-national studies would be necessary to further examine this. In addition, the current study focused on rape cases, and not much is known about how the level of BJW affects judgment of other crimes. Although the vignette method is widely used in this area of study, it can be criticized for potentially lacking the ability to demonstrate the processes at play during blame attribution.

1 IN 6 WOMEN

1 out of every 6 American women has been the victim of an attempted or completed rape in her lifetime (14.8% completed, 2.8% attempted).

Reliability of Legal Sanity Evaluations

W. Neil Gowensmith, Marcus T. Boccaccini, & Daniel C. Marrie

Abstract

This study was conducted to test the reliability of evaluations done to determine legal sanity across different evaluators. Out of 165 cases, almost half of the defendants' legal sanity resulted in a disagreement by evaluators.

Introduction

Conducted by Neil Gowensmith, Daniel Murrie, and Marcus Boccaccini., a study in Hawaii, collected data on defendants whose legal sanity was questioned in the court. The state of Hawaii was chosen due to its system that requires three different evaluators when deeming a defendant competent to stand trial. This study was conducted to see if the standard for the evaluation of insanity should be changed.

Methods

Cases

- 165 cases where legal sanity was questioned in the state of Hawaii
- 483 legal sanity evaluations with three different evaluators
- Three evaluators included one chosen from the DOH and two that are private psychologists
- None of the evaluators are chosen by the prosecution or defense
- Evaluators did not have contact or confer with one another.

Data Collected

- Characteristics of the defendant-age, gender, ethnicity, recent hospitalizations, and substance abuse at the time of the crime
- Characteristics on the evaluators-professional disposition and affiliation
- Characteristics of the evaluations-date and referral court
- The consent and conclusions of the evaluations.

Results

Conclusion

- Only in 55.1% of the cases did all three of the evaluators agree with one another
- Judges would side with diagnosis 91% of the time when all three evaluators agreed with each other
- Applied for both sane and insane diagnosis
- Generalizability limited due to data only being from one area(Hawaii)
- Lack of data collection of training received for psychiatric or psychological evaluator makes applicability limited
- Previous diagnosis or hospitalization 6 months prior to crime lead to stronger agreement on diagnosis of evaluation
- Same was true if offender was under influence of drugs at time of crime
- 29.5% of the cases where evaluators disagreed about sanity, they disagreed about psychosis
- Fukunaga et al (1982) found different results.
- Larger sample size over different jurisdictions would help improve generalizability and applicability of results
- Until more research is done it will hinder the competency of mental health professionals and the legal system as a whole

➔ There is no one “correct” way to make a poster, but yours should be:

- 🧠 visually appealing
- 🧠 proof read
- 🧠 logical & organized

This [website](#) provides a range of resources related to making and presenting posters.

Each group may organize the poster creatively, but the poster should include the following content:

➡ Title Section

➡ Introduction

🧠 Background information about the literature or theory that prompted the research.

➡ Method

🧠 Participants: Who (what) and how they were selected

🧠 Materials: Equipment, measures, and materials used to collect data

🧠 Procedure: Treatment and data collection process

➡ Results

🧠 Description of the data analysis process and results. Does not need to be too detailed or statistics based. Use visualizations and charts to show findings.

➡ Discussion

🧠 Relating the findings to the previous literature, limitations & future directions.

➡ Ethics

🧠 Identify and describe any obvious violations of ethical standards in the study.

You may find it useful to watch [this video](#) on creating scientific posters in PowerPoint.

- ➡ You should save your final poster as a PDF
- ➡ Submit it to canvas (only one per group) by the due date

- ➡ Write a script & practice!
- ➡ Focus on the main research question and what they found
 - 🧠 Also, explain why it matters
- ➡ Record and submit your individual presentation on Canvas by the due date

BE CREATIVE & HAVE SOME FUN!

YOUR POSTER TITLE HERE: AND INCLUDE A SUBTITLE IF YOU HAVE ONE FIRST AUTHOR, SECOND AUTHOR, THIRD AUTHOR AFFILIATION 1, AFFILIATION 2, AFFILIATION 3
